

# Instruction Set

---

**Version:** 0.5.0

**Total Instructions Supported:** 73

**Operand Size:** Up to 2 operands, each of 64-bits

---

## Operand Types

Instructions in SASM accept a variety of operand types:

??? example "Immediate Values"

```
0, 1, 2, 3
```

??? example "Constants"

```
M, N, 0, P
```

??? example "Registers"

```
L0, L1, L2, L3
```

---

## Register Dereferencing

SASM registers are identified by **unique IDs**. Each register can be accessed either as a **reference** or as a **value** using *compile-time functions*.

```
ref(L1) ; reference to register L1  
val(L1) ; value stored in register L1
```

These are **compile-time functions** that tell the assembler how to interpret operands.
